

## Dandelion Flower Identification

Dandelions can be found growing almost everywhere around the world. They are hearty and can grow in the most unlikely places. Their familiar sunny yellow blooms greet us from lawns, fields, and cracks in pavement.

Let's take a closer look at the Dandelion.

- Dandelion leaves grow in a rosette and have long lance-shaped leaves.
- The leaves are irregularly shaped but all have pointed edges and the “teeth” are pointing toward the center of the plant.
- The stem is hollow and has a milky sap.
- Only one bloom grows on each stem.
- The yellow flower we see is actually many, many tiny individual flowers - each producing their own seed!
